        EXPERIMENT
 Title
          SPECIAL FIBONACCI
          Description <
            Alex is exploring a series and she came across a special series, in which
            f(N)=f(N-1)*f(N-1)+f(N-2)*f(N-2) \mod 47
            where f(0) = 1. f(1)=1
            Your task is to help Alex find and return an integer value, representing the Nth number in this special series.
            Input Specification:
            input1: An integer value N.
            Output Specification:
            Return an integer value, representing the Nth number in this special fibonacci series.
            Sample Input:
            4
            Sample Output:
            29
 Source Code:
            def fib(n,memo={}):
                if n==0 or n==1:
                    return 1
                if n in memo:
                res=(fib(n-1,memo)**2+fib(n-2,memo)**2)%47
                memo[n]=res
                return res
            n=int(input())
            print(fib(n))
        RESULT
```
